Project Work Proposal

For the project our team was planning to observe and analyse the process a company must go through in order to migrate their services and infrastructure from in house data centre to the cloud providers.

Our current candidates are AWS, Azure, Google and IBM, although this is subject to change as we might find more suiting candidates or narrow down on certain ones.

Our plan is to create a fictional company, for which the details we will figure out in the upcoming weeks and select a couple of suitable cloud service providers according to its needs and their potential. Afterwards we aim to go through the process of transferring everything from the old, conventional system to the new cloud platform. And finally determine which cloud service provider is the best, easiest and so on.
